Eighteen B by Bolt Threads

Eighteen B by Bolt Threads

New York – New skincare label **Eighteen B** draws on biotechnology and **material futures** for its range of silk protein products.

Working to the mantra that better science equals better skin, its proprietary b-silk protein was created as a response to the overly-processed ingredients used in skincare today. The b-silk protein is made using a lab-based fermentation process and is the key component in Eighteen B's range of lightweight and rich moisturisers, which promise to lock in moisture and promote lift, firmness and long-term skin health.

Created by Lindsay Wray, the brand's chief science officer and a material scientist at **Bolt Threads**, the range also endorses a clean approach to beauty. 'As the market rapidly evolves, the Eighteen B team is committed to rigorous testing and the development of safe, effective products that serve the health of your skin and our environment,' reads a brand statement.
