Los Angeles – The start-up's **Coinmine One** device uses electricity and computer power to simplify the mining and management of cryptocurrency.

While crypto mining typically requires several pieces of hardware and wallet solutions, which can be difficult to obtain, the Coinmine One offers a more straightforward way for newcomers to become miners.

The hardware product is minimalist in design, allowing it to sit on a desk or in the home. It automates the creation of cryptocurrency wallets in one place, using only electricity and computing power. It also comes with an app to further simplify the process. 'Many people want to be a part of the crypto revolution, but crypto hardware, software and wallets are too hard and time consuming to set up, and more importantly, to update,' reads a statement from the company.

Retailing for \$799 (£624, €708), the device falls at the higher end of the market, making it a product suited to those chasing **Crypto-affluence**.
